

Marietta City Schools  
2023–2024 District Unit Planner

Grade 5 Science

Theme	Unit 2 Dynamics of Classification	Unit duration	7 weeks
-------	-----------------------------------	---------------	---------

Mastering Content and Skills through INQUIRY (Establishing the purpose of the Unit): *What will students learn?*

GSE Standards

Georgia Standards:

**SS11. Obtain, evaluate, and communicate information to group organisms using scientific classification procedures.**

- Develop a model that illustrates how animals are sorted into groups (vertebrate and invertebrate) and how vertebrates are sorted into groups (fish, amphibian, reptile, bird, and mammal) using data from multiple sources.
- Develop a model that illustrates how plants are sorted into groups (seed producers, non-seed producers) using data from multiple sources.

**SS12. Obtain, evaluate, and communicate information showing that some characteristics of organisms are inherited and other characteristics are acquired.**

- Ask questions to compare and contrast instincts and learned behaviors.
- Ask questions to compare and contrast inherited and acquired physical traits. (Clarification statement: Punnett squares and genetics are taught in future grades.)

**Unit Objectives:**

Model classification of plants and animals.

Determine, by asking questions, the similarities and difference between inherited vs. acquired characteristics.

**Unit Phenomena: Unit Phenomena:**

[Phenomena Classification](#): Living things may look alike but can be classified into different groups.

- Show students the pictures (teachers may add additional pictures to increase rigor) and ask them to classify the organisms into “x” number of groups (2 or 3) in a way that makes sense to them.
- Have a student share how/why they classified their organisms as they did.
- Ask the rest of the students if anyone classified their organisms into different groups and have them share.
- Introduce and ask students to define what they think the term “traits” means. This can be done through a think-pair-share. Have a few students share their definitions. • Follow-up by asking students what traits they used to classify their organisms (the teacher can list these on the board or SMART board).

- Introduce the terms “inherited” and “acquired.” Ask students whether the traits they described would be considered inherited or acquired and note this on the board.
- This discussion can be used to launch into how traits are used to classify animals into groups such as vertebrate and invertebrate, and vertebrates into fish, amphibian, bird, reptile, and mammal; and plants into seed-producers/non-seed producers, etc.

**Page Keeley Probes:** [Click here for an introduction to Page Keeley Probes](#)

Page Keeley probes can be used as phenomena. They are intended to elicit student understanding about science concepts. Starting a unit or lesson with a probe will help you uncover misconceptions and see what students already know about a topic. Using a probe at the beginning of a lesson and then at the end of the lesson serves the purposes of pretesting and then formatively evaluating student thinking. Below is a list of probes from Page Keeley’s book *Uncovering Student Ideas in Primary Science*, that are appropriate for this unit. This book has been purchased for your grade level by the Office of Academic Achievement and can be found in your media center.

- Is It an Animal? (Volume 1)
- IsIt Living? (Volume 1)
- IsIt Made of Cells? (Volume 1)
- Is It a Plant? (Volume 2)

--	---	---

**Misconceptions:**

- Insects are not animals.
- All animals in the aquatic (water) environment are classified as fish.
- Amphibians and reptiles are part of the same group.
- Toads and frogs are the same.
- Snakes are not vertebrates.
- Human beings are not animals.
- Mushrooms are plants.
- Grass is not a plant.
- Students may confuse examples of inherited traits vs. acquired traits.
- Students may confuse examples of instinctive vs. learned behaviors.

**Math/ELA Connections/STEM Connections**

ELAGSE5RI2 Determine two or more main ideas of a text and explain how they are supported by key details; summarize the text.

ELAGSE5W2 Write informative/explanatory texts to examine a topic and convey ideas and information clearly.

- Introduce a topic clearly, provide a general observation and focus, and group related information logically; include formatting (e.g., headings), illustrations, and multimedia when useful to aid comprehension.
- Develop the topic with facts, definitions, concrete details, quotations, or other information and examples related to the topic.

**MATH:**

3. Construct viable arguments and critique the reasoning of others. In fifth grade, students may construct arguments using concrete referents, such as objects, pictures, and drawings. They explain calculations based upon models and properties of operations and rules that generate patterns. They demonstrate and explain the relationship between volume and multiplication. They refine their mathematical communication skills as they participate in mathematical discussions involving questions like “How did you get that?” and “Why is that true?” They explain their thinking to others and respond to others’ thinking.

4. Model with mathematics. Students experiment with representing problem situations in multiple ways including numbers, words (mathematical language), drawing pictures, using objects, making a chart, list, or graph, creating equations, etc. Students need opportunities to connect the different representations and explain the connections. They should be able to use all of these representations as needed. Fifth graders should evaluate their results in the context of the situation and whether the results make sense. They also evaluate the utility of models to determine which models are most useful and efficient to solve problems.

**STEM**

[Classification Systems Engineering Design Challenge](#) – From Teach Engineering - Students are introduced to the classification of animals and animal interactions. Students also learn why engineers need to know about animals and how they use that knowledge to design technologies that help other animals and/or humans. This lesson is part of a series of six lessons in which students use their growing understanding of various environments and the engineering design process, to design and create their own model biodome ecosystems. Included is a [biomimicry Engineering Design Challenge](#).

**Discovery Education Science Techbook** (Log into your DE account using your Google credentials before accessing the DE resources) You will find station rotation activities such as leveled reading passages, interactives, hands-on labs, virtual labs, video clips, and more on the Explore page of each Techbook unit.

[Physical Features](#)

[Growth and Development](#)

[Learning](#)

**Discovery Education Hands-on Activities**

[Hands-On Activity: Comparing Traits](#)

[Hands-On Activity: Hiding in Plain Sight](#)

[Hands-On Activity: Plant Adaptations](#)

[Hands-On Lab: Habitat Hide-and-Seek](#)

[Hands-On Activity: Comparing the Physical Features of Animals](#)

**Essential Questions**

**Factual—**

Explain the difference between vertebrates and invertebrates with examples to support reasoning.

Explain the difference between seed producers and non-seed producers examples to support reasoning.

Explain the difference between nonvascular and vascular plants with examples to support reasoning.

**Inferential—**

How do scientists compare and contrast instincts and learned behaviors provide evidence to support reasoning?

How do scientists compare and contrast inherited and acquired physical traits and provide evidence to support reasoning?

**Critical Thinking-**

Construct an argument supported by scientific evidence to identify a specific trait as being inherited vs. acquired.

Explain why insects are classified as animals and provide evidence to support reasoning.

Explain how amphibians and reptiles are classified and provide evidence to support reasoning.
