Mastering Content and Skills through INQUIRY (Establishing the purpose of the Unit): What will students learn?

GA DoE Standards

Standards

8.PAR.3*: (Integrate along with the content included in A.FGR.2) Create and interpret expressions within relevant situations. Create, interpret, and solve linear equations and linear inequalities in one variable to model and explain real phenomena.

8.PAR.3.1 Interpret expressions and parts of an expression, in context, by utilizing formulas or expressions with multiple terms and/or factors.

8.PAR.3.2 Describe and solve linear equations in one variable with one solution (x = a), infinitely many solutions (a = a), or no solutions (a = b). Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form x = a, a = a, or a = b results (where a and b are different numbers).

8.PAR.3.3 Create and solve linear equations and inequalities in one variable within a relevant application.

8.PAR.3.4 Using algebraic properties and the properties of real numbers, justify the steps of a one-solution equation or inequality.

8.PAR.3.5 Solve linear equations and inequalities in one variable with coefficients represented by letters and explain the solution based on the contextual, mathematical situation.

8.PAR.3.6 Use algebraic reasoning to fluently manipulate linear and literal equations expressed in various forms to solve relevant, mathematical problems.

8.PAR.4*: (teach before beginning work with linear functions through A.FGR.2) Show and explain the connections between proportional and nonproportional relationships, lines, and linear equations; create and interpret graphical mathematical models and use the graphical, mathematical model to explain real phenomena represented in the graph.

8.PAR.4.2 Show and explain that the graph of an equation representing an applicable situation in two variables is the set of all its solutions plotted in the coordinate plane.

A.FGR.2: Construct and interpret arithmetic sequences as functions, algebraically and graphically, to model and explain real-life phenomena. Use formal notation to represent linear functions and the key characteristics of graphs of linear functions, and informally compare linear and nonlinear functions using parent graphs.

A.FGR.2.1 Use mathematically applicable situations algebraically and graphically to build and interpret arithmetic sequences as functions whose domain is a subset of the integers

Fundamentals - Students should be able to:

- make connections between linear functions and arithmetic sequences presented in mathematically applicable situations.
- build and interpret arithmetic sequences as functions presented graphically and algebraically.
- convert arithmetic sequences from explicit to recursive form and vice versa.
- define sequences recursively and explicitly.

Example - By graphing or calculating terms, students should be able to show how the arithmetic sequence in recursive form \( a_1=7, a_n=a_{n-1} + 2 \); the arithmetic sequence in explicit form \( a_n = 2(n-1) + 7 \); and the function \( f(x) = 2x + 5 \) (when \( x \) is a natural number) all define the same sequence.

Published: August, 2023

Resources, materials, assessments not linked to SGO or unit planner will be reviewed at the local school level.
A.FGR.2.2 Construct and interpret the graph of a linear function that models real-life phenomena and represent key characteristics of the graph using formal notation.

Strategies and Methods
• Students should be able to use graphs created by hand and with technology, verbal descriptions, tables, and function notation when analyzing linear functions that represent real-life phenomena.
• Students should be given opportunities to use interactive graphing technologies to explore and analyze key characteristics of linear functions, including domain, range, intercepts, intervals where the function is increasing or decreasing, positive or negative, maximums and minimums over a specified interval, and end behavior.

Fundamentals
• Students should be able to express characteristics in interval and set notation with linear functions.
• Students should be able to interpret the key characteristics of the graph in a situation.

A.FGR.2.3 Relate the domain and range of a linear function to its graph and, where applicable, to the quantitative relationship it describes. Use formal interval and set notation to describe the domain and range of linear functions.

Examples
• If the function h(n) gives the number of hours it takes a person to assemble n engines in a factory, then the set of positive integers would be an appropriate domain for the function. • Use symbolic notation to represent the domain and range of a linear function, considering the specific context.

\[ (-\infty, \infty) \quad [3, \infty) \quad D: \{x \mid x \in \mathbb{R}\} \quad D: \{x \mid x > 0\} \quad D: \{x \mid x = 1, 2, 3, 4, 5, \ldots\} \quad R: \{y \mid y = 10, 20, 30, \ldots\}\]

A.FGR.2.4 Use function notation to build and evaluate linear functions for inputs in their domains and interpret statements that use function notation in terms of a mathematical framework.

Fundamentals
• Students should develop a deep understanding of function notation to build, evaluate, and interpret linear functions; this understanding will be applied to other functions studied hereafter.

A.FGR.2.5 Analyze the difference between linear functions and nonlinear functions by informally analyzing the graphs of various parent functions (linear, quadratic, exponential, absolute value, square root, and cube root parent curves).

Fundamentals
• Students should explore the parent function graphs to compare linear and nonlinear relationships (including a visual analysis of end behavior, increasing and decreasing, domain and range, intercepts, and general curvature).
• Learning all the characteristics of these nonlinear functions is not an expectation for this learning objective.
• Students should be able to identify parent functions by name (i.e., linear, quadratic, etc.).
• Students should have opportunities to explore the various graphs using technology.

Strategies and Methods
• Students should be able to informally analyze the curvature of several parent functions to highlight the characteristics of linear functions in comparison to several nonlinear functions.
• This is an introduction to functions they will explore in future units and courses.
• Students should be provided opportunities to utilize graphing calculators and interactive graphing technologies to explore this concept.

A.MM.1: Apply mathematics to real-life situations; model real-life phenomena using mathematics
A.MM.1.1 Explain applicable, mathematical problems using a mathematical model.

Fundamentals
• Students should be provided with opportunities to learn mathematics in the framework of real-life problems.
Mathematically applicable problems are those presented in which the given framework makes sense, realistically and mathematically, and allows for students to make decisions about how to solve the problem (model with mathematics).

**A.MM.1.2** Create mathematical models to explain phenomena that exist in the natural sciences, social sciences, liberal arts, fine and performing arts, and/or humanities domains.

**Fundamentals**
- Students should be able to use the content learned in this course to create a mathematical model to explain real-life phenomena.

**A.MM.1.4** Use various mathematical representations and structures with this information to represent and solve real-life problems.

**Strategies and Methods**
- Students should be able to fluently navigate between mathematical representations that are presented numerically, algebraically, and graphically.
- For graphical representations, students should be given opportunities to analyze graphs using interactive graphing technologies.

**A.MM.1.5** Define appropriate quantities for the purpose of descriptive modeling.

**Fundamentals**
- Given a situation, framework, or problem, students should be able to determine, identify, and use appropriate quantities for representing the situation.

**Concepts/Skills to support mastery of standards**

Students will construct and interpret arithmetic sequences as functions, both algebraically and graphically.

Students will need to maintain their ability to interpret linear functions, including key characteristics using proper notation.

Students should be able to compare linear and nonlinear functions informally.

**Vocabulary**

<table>
<thead>
<tr>
<th>Arithmetic Sequence</th>
<th>Continuous</th>
<th>Dependant Variable</th>
<th>Discrete</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

**Notation**

| Function Notation - \( f(t) \) | Interval Notation - \([,] , (,)\) | Set Notation - \( D: \{x \mid x \in R \} \) (Set of all real numbers) , \( R: \{y \mid y \in R \}, \{x \mid 5 \leq x \leq 7\} \) |
|------------------|----------------|-------------------|-----------------|

**Key concept**

<table>
<thead>
<tr>
<th>Form - The shape and underlying structure of an entity or piece of work, including its organization, essential in nature and external appearance.</th>
<th>Related concept(s)</th>
<th>Global context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change, Model, Pattern</td>
<td>Identities and Relationships - Physical, psychological and social development; transitional; health and well-being; lifestyle choices</td>
<td></td>
</tr>
</tbody>
</table>

**Statement of inquiry**

Forms of identities and relationships model psychological and social development using patterns and changes throughout health and well-being activities.
## Inquiry questions

### Factual—
- What is the common difference in a sequence?
- What is the domain and range of a linear function?
- What are the intercepts of a linear function?
- What is the slope of a linear function?

### Conceptual—
- How do we use arithmetic sequences as functions to model and explain real-life phenomena?
- How do we identify characteristics of linear functions in context?

### Debatable-
- Is it more effective to represent linear functions using formal notation or informally compare them to non-linear functions using parent graphs?

<td><strong>A.FGR.2.1</strong> Use mathematically applicable situations algebraically and graphically to build and interpret arithmetic sequences as functions whose domain is a subset of the integers.</td>
<td><strong>Exploring Patterns (Art Designs)</strong>&lt;br&gt;Description: In this learning plan, students will explore visual and numerical patterns to understand arithmetic sequences. Students will make connections between arithmetic sequences and linear functions by examining explicit equations. Students will make connections, in context, and apply their knowledge to create their own patterns and critique the patterns of their peers.&lt;br&gt;&lt;br&gt;<strong>Learning Goals:</strong>&lt;br&gt;1. I can use arithmetic sequences to describe patterns.&lt;br&gt;2. I can identify arithmetic sequences in linear functions to describe real world phenomena.&lt;br&gt;3. I can construct and interpret graphs of linear functions.</td>
<td>Remedial support can provide counters and other manipulatives to represent patterns. Language Supports could include vocabulary such as common difference, arithmetic, sequence, and formula. Enrichment opportunities could include more contextual examples.</td>
</tr>
<tr>
<td><strong>A.FGR.2.2</strong> Construct and interpret the graph of a linear function that models real-life phenomena and represent key characteristics of the graph using formal notation.</td>
<td><strong>Exploring Growth Rates - Baby Denise</strong>&lt;br&gt;Description: In this learning plan, students will have multiple opportunities to explore the growth rate of a baby girl named Denise. The students will develop a linear model to predict the length of Denise at different ages. The model is then tested by finding the predicted length of Denise at ages ranging from 1 year to 5 years of age. The students will then create mathematical arguments as to the validity of the domain and range for different functions.&lt;br&gt;&lt;br&gt;<strong>Learning Goals:</strong>&lt;br&gt;1. I can read and interpret function notation in real-world applications.&lt;br&gt;2. I can analyze the validity of a mathematical model in a real-world application.</td>
<td>Remedial support could utilize peg boards and technology to look at lines in a coordinate plane. Language Supports could include preview of vocabulary and intentional conversation of context and how that relates to their home language and culture. Enrichment opportunities can have students complete the targeted questions throughout the task. Encourage critical thinking and deeper connections.</td>
</tr>
<tr>
<td><strong>A.FGR.2.4</strong> Use function notation to build and evaluate linear functions for inputs in their domains and interpret statements that use function notation in terms of a mathematical framework.</td>
<td></td>
<td></td>
